

QR-Based Anonymous Calling API – Functional Documentation

Overview

This customization enables QR-based anonymous communication between a vehicle owner and a scanner without exposing either party's mobile number.

Workflow

1. API Request

Hit the Outbound QR API using the user token only.

API Endpoint:

<https://panelv3.cloudshope.com/api/outboundCallQr>

Request Payload:

```
{  
  "mobile_number": "7060431865"  
}
```

Note:

The mobile_number field should contain the vehicle owner's registered mobile number.

2. DID Generation

Upon successful API request:

- The system generates a unique DID (virtual number).
- This DID is mapped to the vehicle owner's mobile number.
- The generated DID is returned in the API response.

3. Scanner to Vehicle Owner Calling

- The scanner calls the generated DID displayed through the QR workflow.
- The DID acts as a bridge between the scanner and the vehicle owner.
- Both parties remain anonymous, and their actual mobile numbers are not exposed.

4. Vehicle Owner Callback Functionality

- If the vehicle owner calls back the generated DID, the call is automatically connected to the original scanner.
- This enables two-way communication while maintaining privacy for both users.

5. Reporting

All call activities are available in the Outbound Reports section, including:

- QR-based outgoing calls
- Callback calls from the vehicle owner
- Call status
- Call duration
- Call timestamps
- Connected party details as per system records

6. Credit Deduction

For every successful QR-based outgoing call:

- Outgoing calling credits will be deducted from the user's account.
- The transaction remark will be recorded as:

"Outgoing QR - "

Example:

Outgoing QR - 7060431865

Benefits

- Anonymous communication between scanner and vehicle owner
- No exposure of personal mobile numbers
- Secure callback mechanism
- Centralized reporting and tracking
- Automated credit management
